

# Hubble: An Advanced Dynamic Folder Technology for XML

Ning Li   Joshua Hui   Hui-I Hsiao   Kevin Beyer

IBM Almaden Research Center  
California, USA

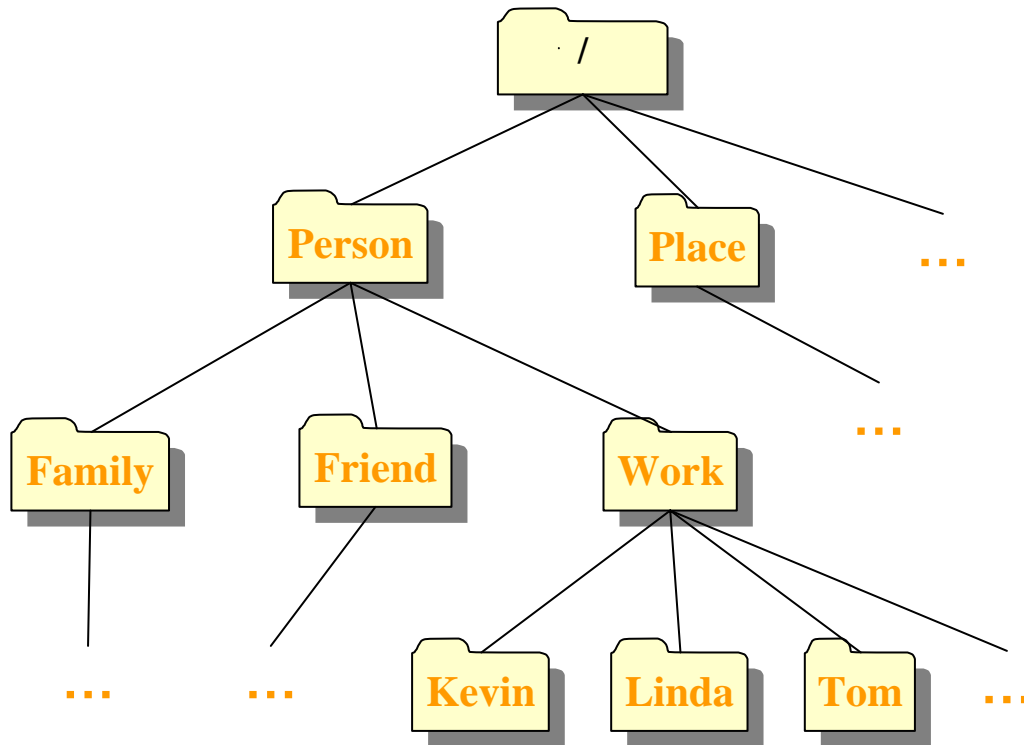

# Background

- Folder/directory hierarchy
  - ▶ People are familiar and comfortable with it
- Amount of information grows faster than people can manage effectively
  - ▶ Challenge: organizing large document collections such that information can be found easily and quickly
- XML and XPath/XQuery
  - ▶ Large amount of XML documents and data collections generated everyday
  - ▶ XML documents are self describing
  - ▶ **New challenge and new opportunity**

# Hubble Objective

- Fully exploit data model and semantics of XML
- Build and manage folders dynamically and efficiently
- Precise categorization and powerful features

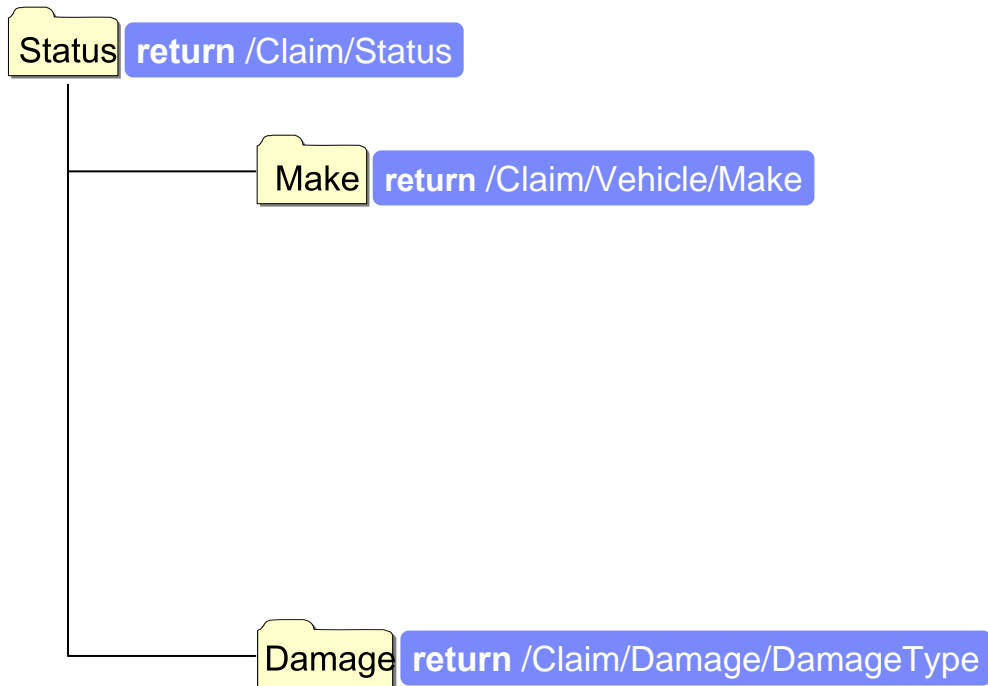

# Example Folder Hierarchy

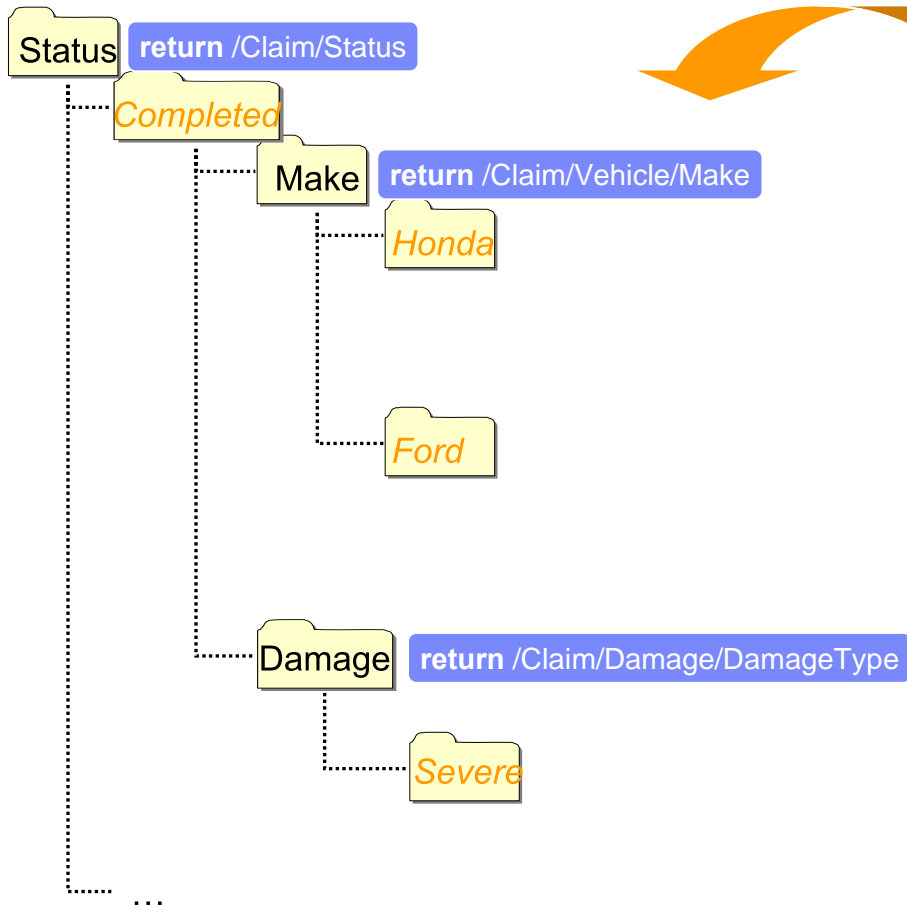

# Hubble Core

- Design-time folder  $df = (dn, dq)$ 
  - $dn$ : name of the design-time folder
  - $dq$ : definition of the design-time folder specified in XQuery
    - ▶ Functions supported on  $df$ 
      - $parentDf(df)$  returns the parent design-time folder of  $df$
      - $childDfs(df)$  returns the set of child design-time folders of  $df$
- Runtime folder  $rf = (df, rv)$ 
  - $df$ : design-time folder that  $rf$  corresponds to
  - $rv$ : runtime value either defined in  $df$  or dynamically generated
    - ▶ Functions supported on  $rf$ 
      - $parentRf(rf)$  returns the parent runtime folder of  $rf$
      - $childRfs(rf)$  returns the set of child runtime folders of  $rf$
      - $childDocs(rf)$  returns the set of documents contained in  $rf$
      - $inRfs(doc)$  returns the set of runtime folders that contain  $doc$

# Design-time Folder Hierarchy

# Runtime Folder Generation

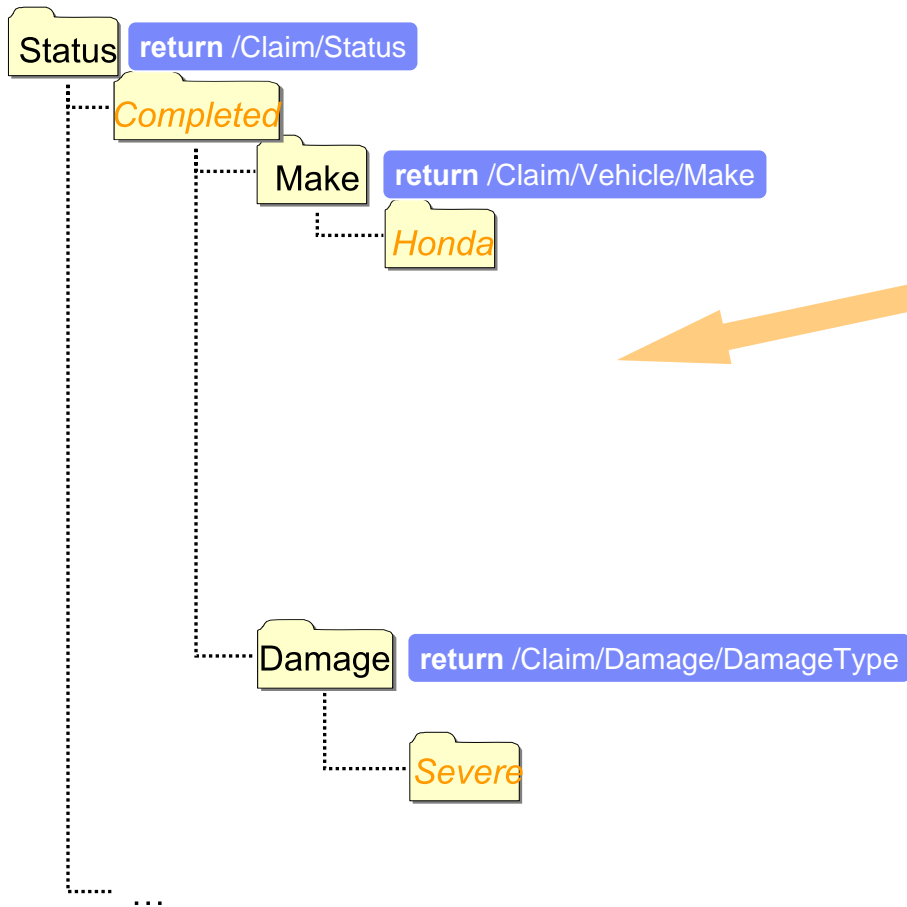

```
<Claim>
  <Status>Completed</Status>
  <Vehicle>
    <Make>Honda</Make>
    <Model>Accord</Model>
  </Vehicle>
  <Vehicle>
    <Make>Ford</Make>
    <Model>Focus</Model>
  </Vehicle>
  <Damage>
    <DamageType>Severe</DamageType>
    ...
  </Damage>
  ...
</Claim>
```

## Runtime Folder Management

- Automatic creation/deletion

# Runtime Folder Maintenance

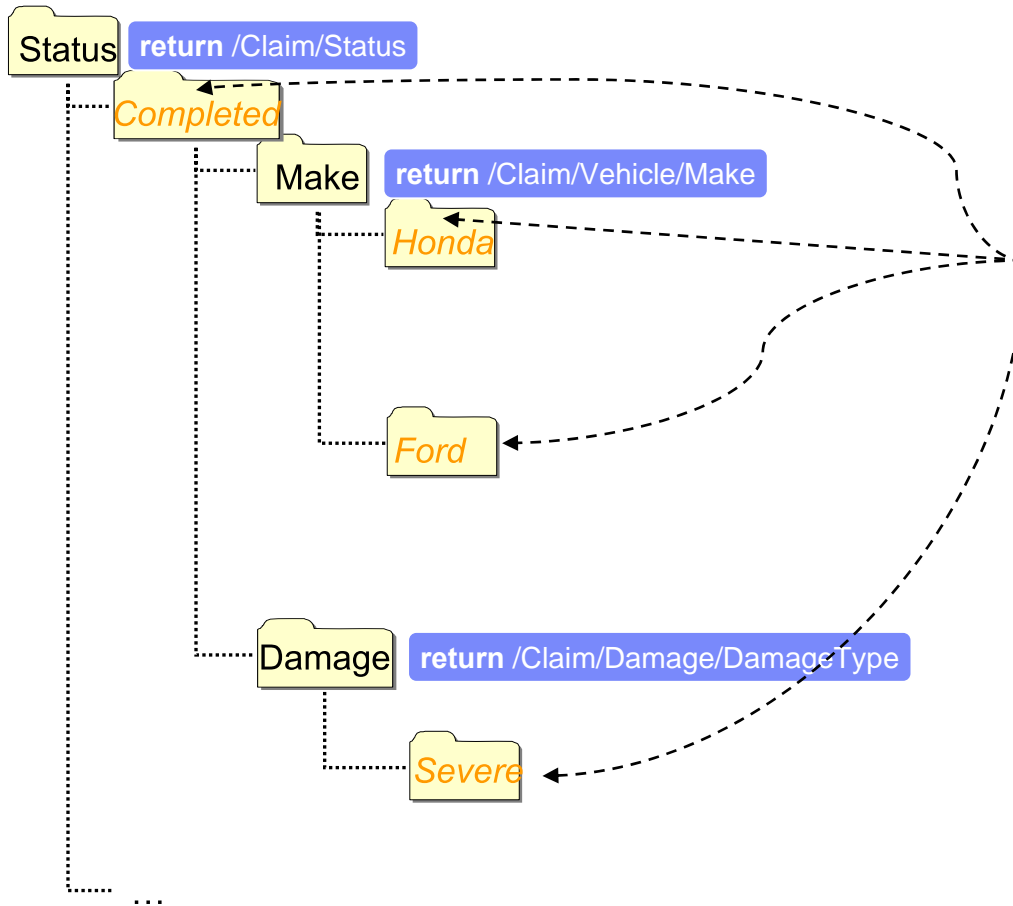

```
<Claim>
  <Status>Completed</Status>
  <Vehicle>
    <Make>Honda</Make>
    <Model>Accord</Model>
  </Vehicle>
  <Vehicle>
    <Make>Ford</Make>
    <Model>Focus</Model>
  </Vehicle>
  <Damage>
    <DamageType>Severe</DamageType>
    ...
  </Damage>
  ...
</Claim>
```

## Runtime Folder Management

- Automatic creation/deletion

# Reverse Navigation

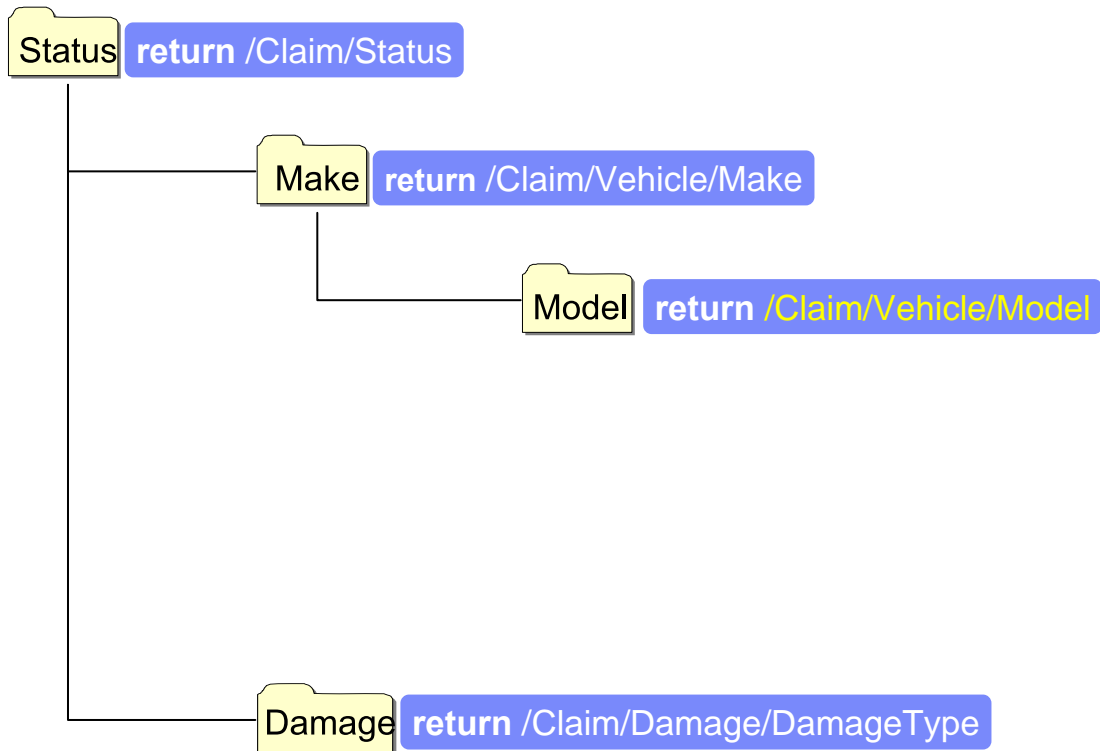

```
<Claim>
  <Status>Completed</Status>
  <Vehicle>
    <Make>Honda</Make>
    <Model>Accord</Model>
  </Vehicle>
  <Vehicle>
    <Make>Ford</Make>
    <Model>Focus</Model>
  </Vehicle>
  <Damage>
    <DamageType>Severe</DamageType>
    ...
  </Damage>
  ...
</Claim>
```

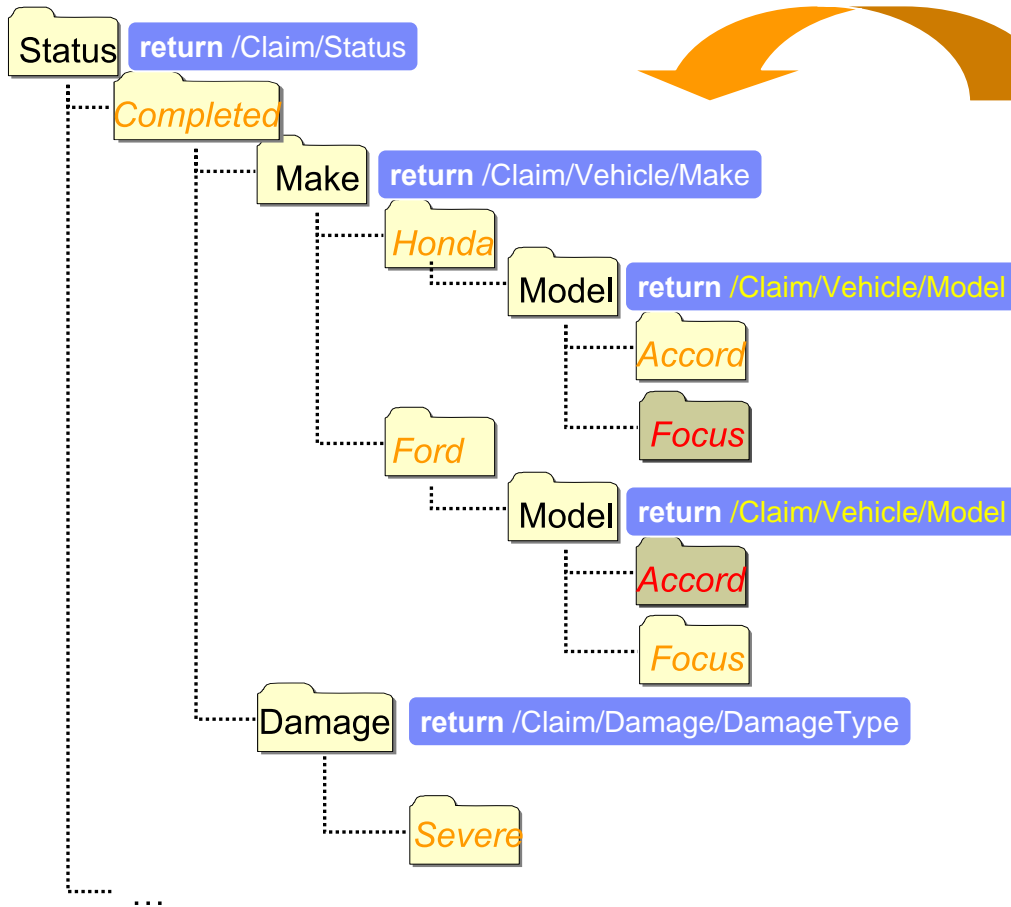

## Runtime Folder Management

- Automatic creation/deletion
- Auto-identification of runtime folders that contain an item

# Extend the Example

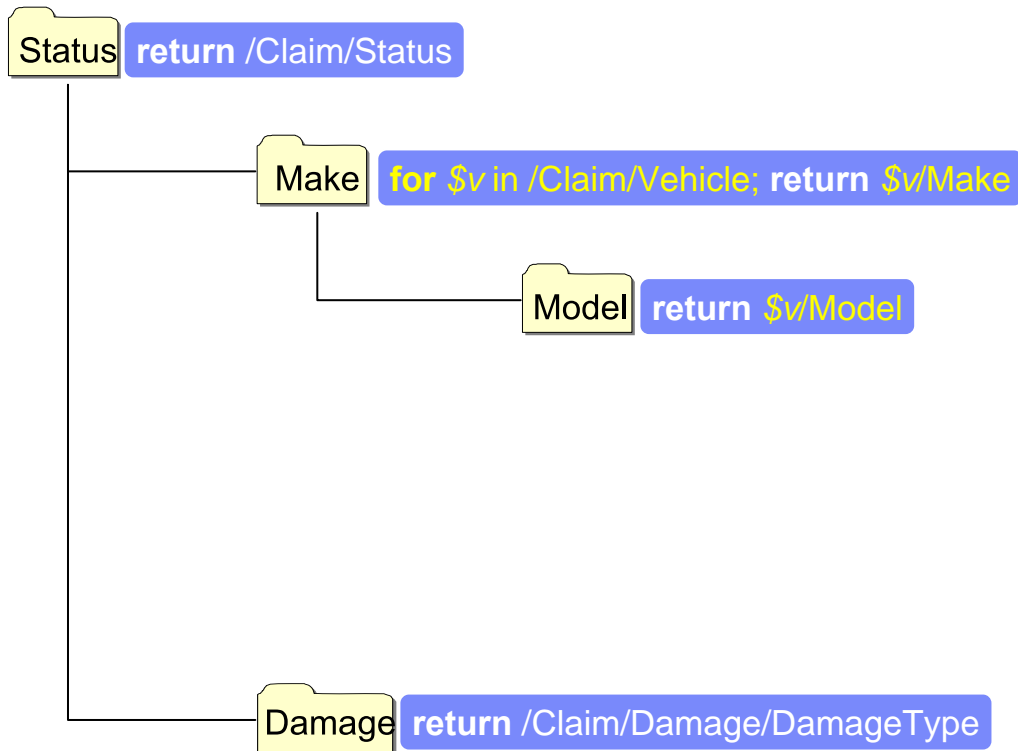

# Extend the Example

```
<Claim>
  <Status>Completed</Status>
  <Vehicle>
    <Make>Honda</Make>
    <Model>Accord</Model>
  </Vehicle>
  <Vehicle>
    <Make>Ford</Make>
    <Model>Focus</Model>
  </Vehicle>
  <Damage>
    <DamageType>Severe</DamageType>
    ...
  </Damage>
  ...
</Claim>
```

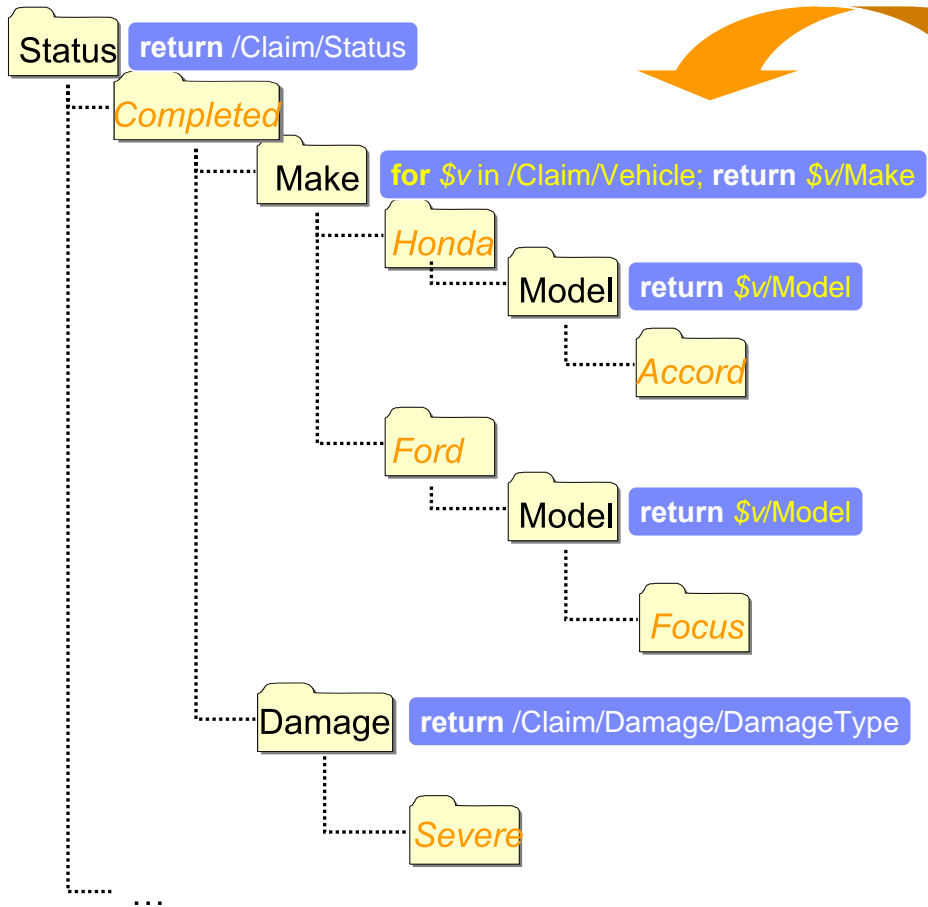

# Variable Binding Mechanism

Extend definition of a design-time folder

- **Variable bindings**
  - ▶ Name of the variable
  - ▶ Definition of the variable specified in XQuery
- **Query definition**
  - ▶ Use variables defined in this folder or any ancestor folder

# Example with Variable Binding

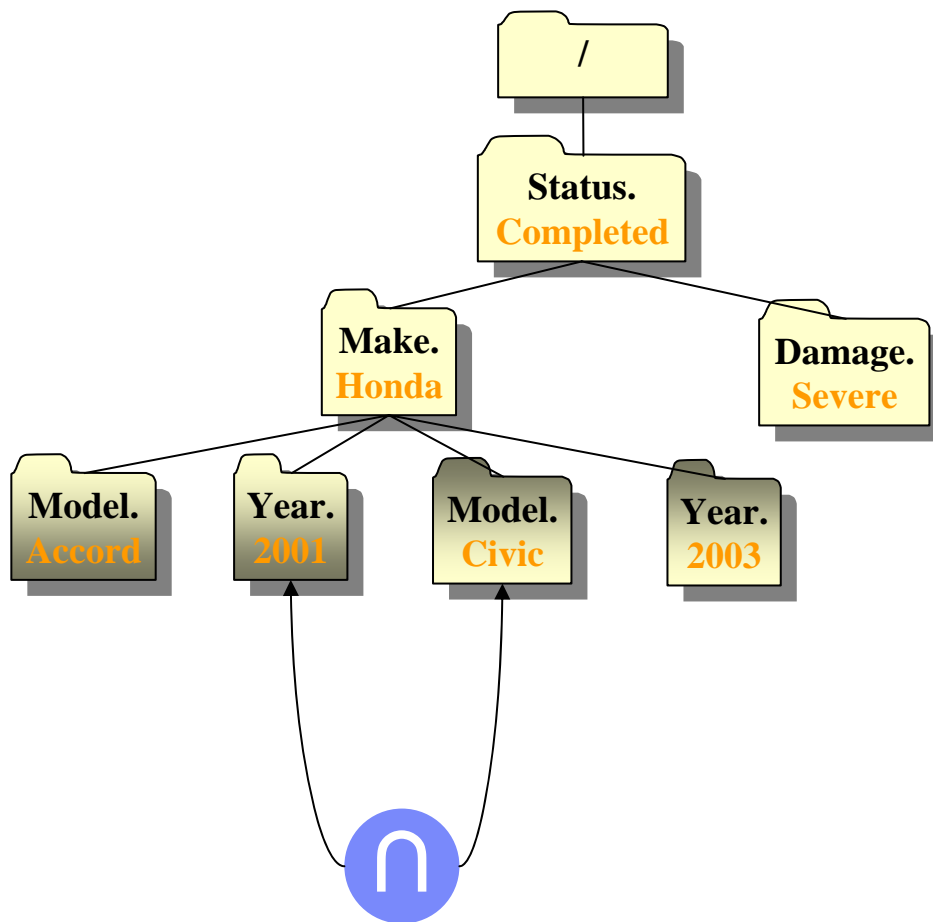

```
<Claim>
  <Status>Completed</Status>
  <Vehicle>
    <Make>Honda</Make>
    <Model>Accord</Model>
  </Vehicle>
  <Vehicle>
    <Make>Ford</Make>
    <Model>Focus</Model>
  </Vehicle>
  <Damage>
    <DamageType>Severe</DamageType>
    ...
  </Damage>
  ...
</Claim>
```

# Advanced Operation

- Multi-path navigation
  - ▶ Operations
    - Intersection
    - Union
    - Difference
  - ▶ Semantics
    - Instance-based semantics – set operation on the documents contained in the runtime folders
    - Definition-based semantics – set operation on the query definitions

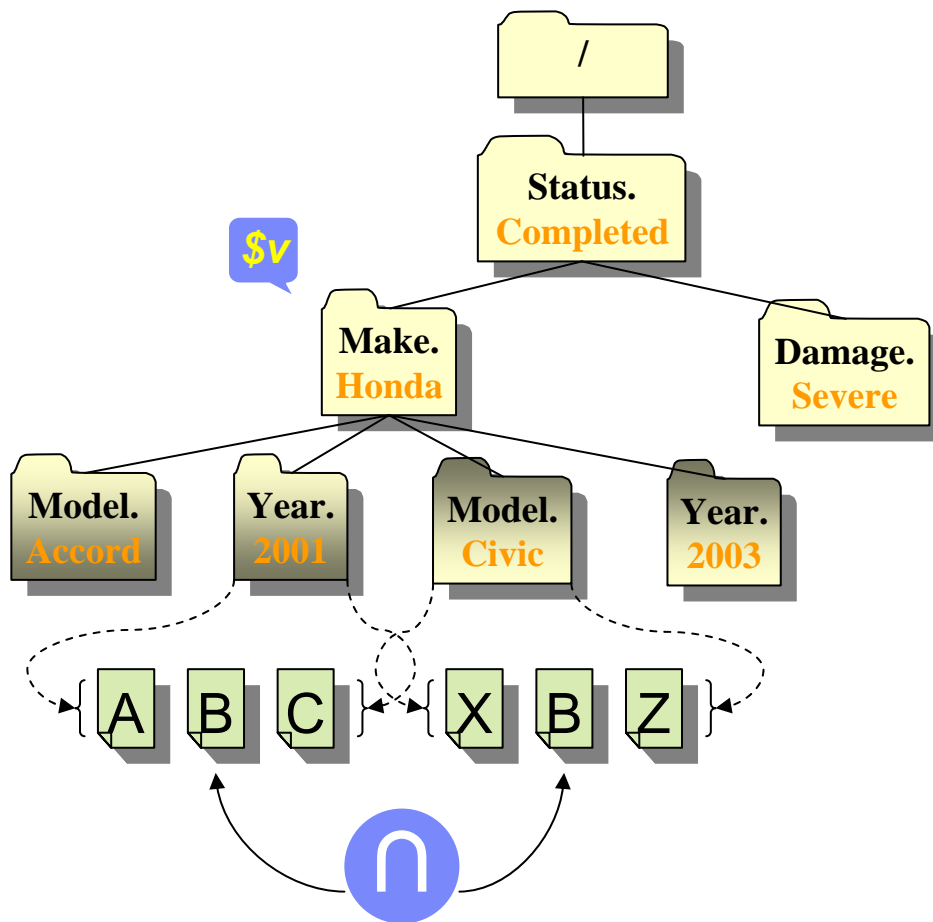

# Multi-path Navigation Example

Add design-time folder Year

- Query: \$v/Year

# Instance-based Semantics

for \$doc in context(),  
**\$v1** in \$doc/Claim/Vehicle,  
 where \$doc/Claim/Status = “completed” and  
     \$v1/Make = “Honda” and  
     \$v1/Model = “Civic”  
 return \$doc

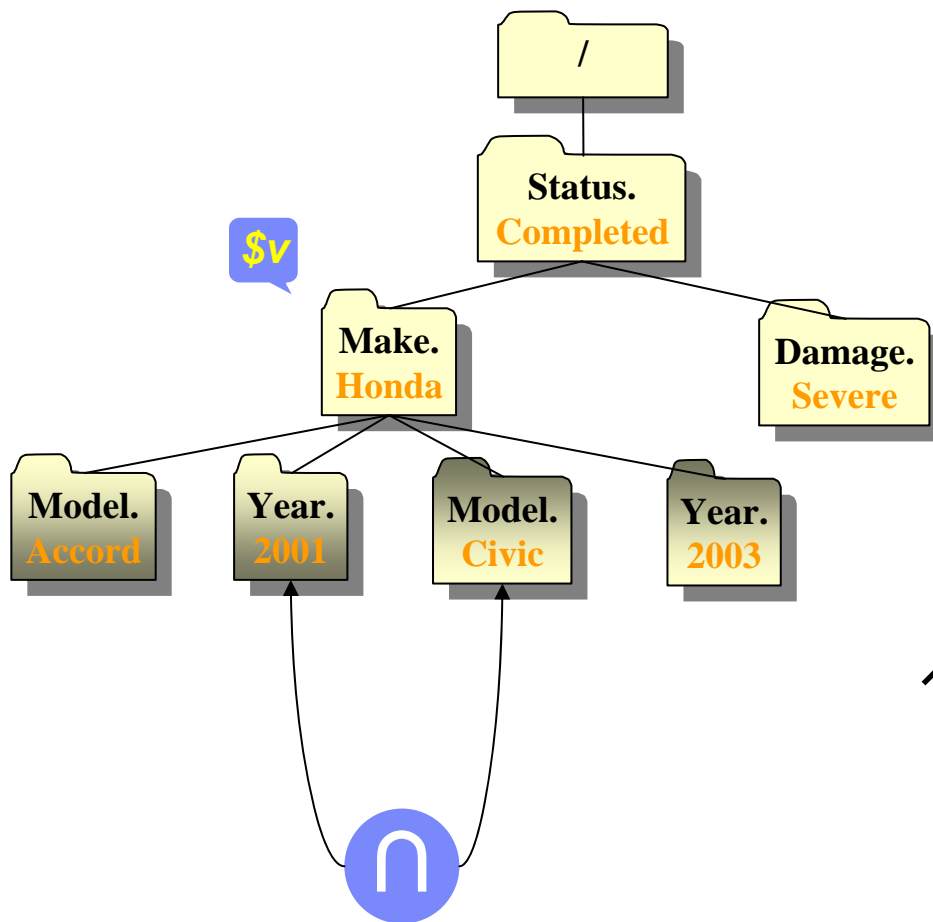

## *intersect*

for \$doc in context(),  
**\$v2** in \$doc/Claim/Vehicle  
 where \$doc/Claim/Status = “completed” and  
     \$v2/Make = “Honda” and  
     \$v2/Year = 2001  
 return \$doc

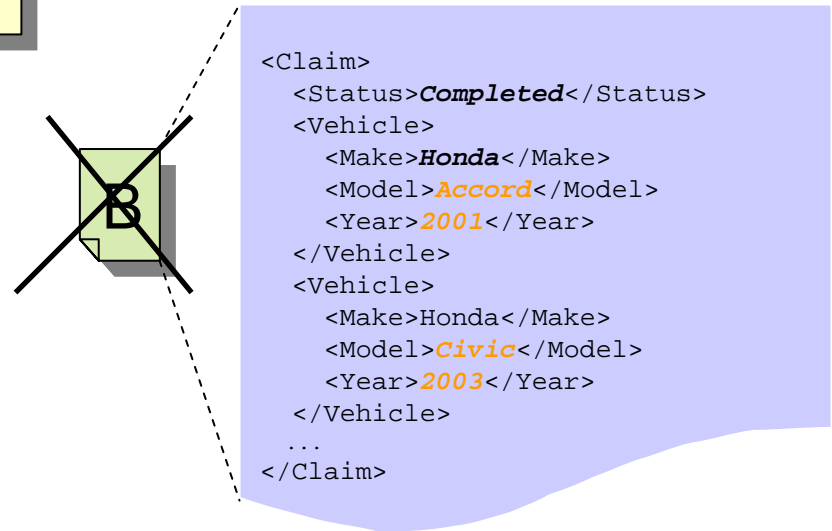

for \$doc in context(),  
**\$v1** in \$doc/Claim/Vehicle,  
**\$v2** in \$doc/Claim/Vehicle  
 where \$doc/Claim/Status = “completed” and  
     (\$v1/Make = “Honda” and  
     \$v1/Model = “Civic”) and  
     (\$v2/Make = “Honda” and  
     \$v2/Year = 2001)  
 return \$doc

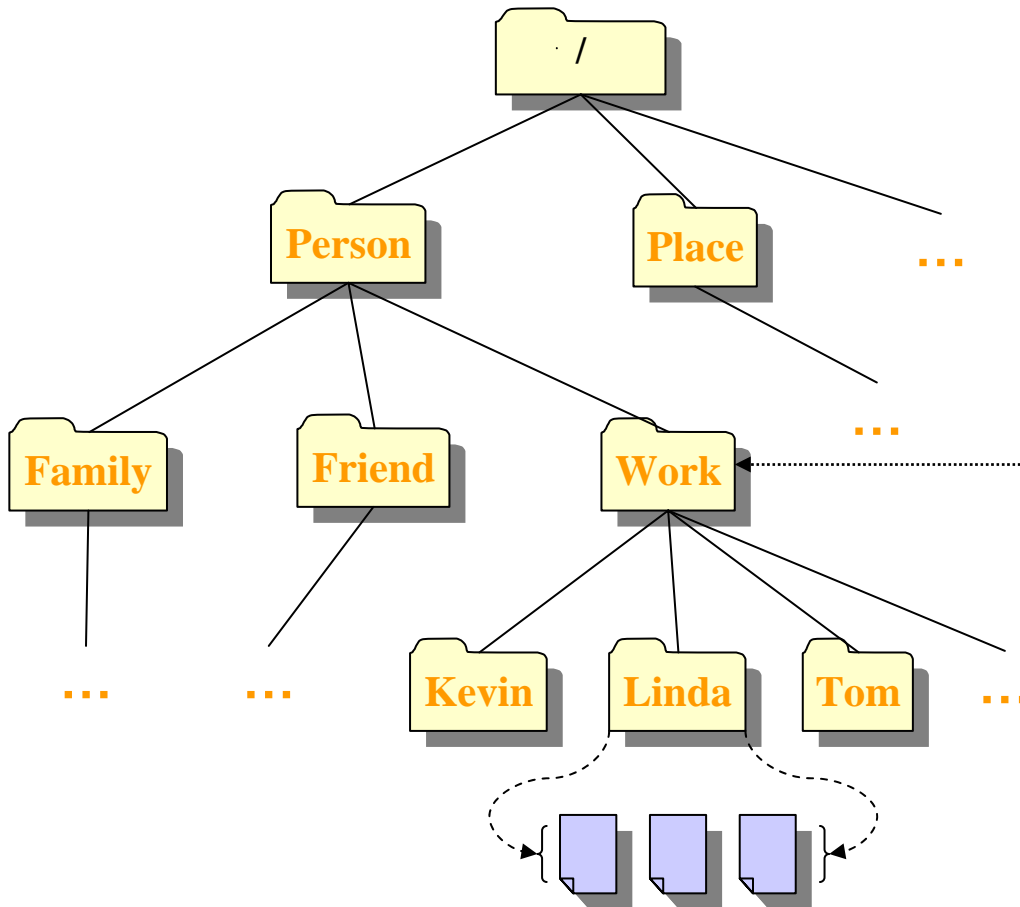

# Definition-based Semantics

for \$doc in context(),  
**\$v** in \$doc/Claim/Vehicle  
where \$doc/Claim/Status = “completed” and  
\$v/Make = “Honda” and  
(**\$v/Model = “Civic”** and  
**\$v/Year = 2001**)  
return \$doc

# Multi-collection Operation – Folder definition referencing documents in other collection

## Photo Collection

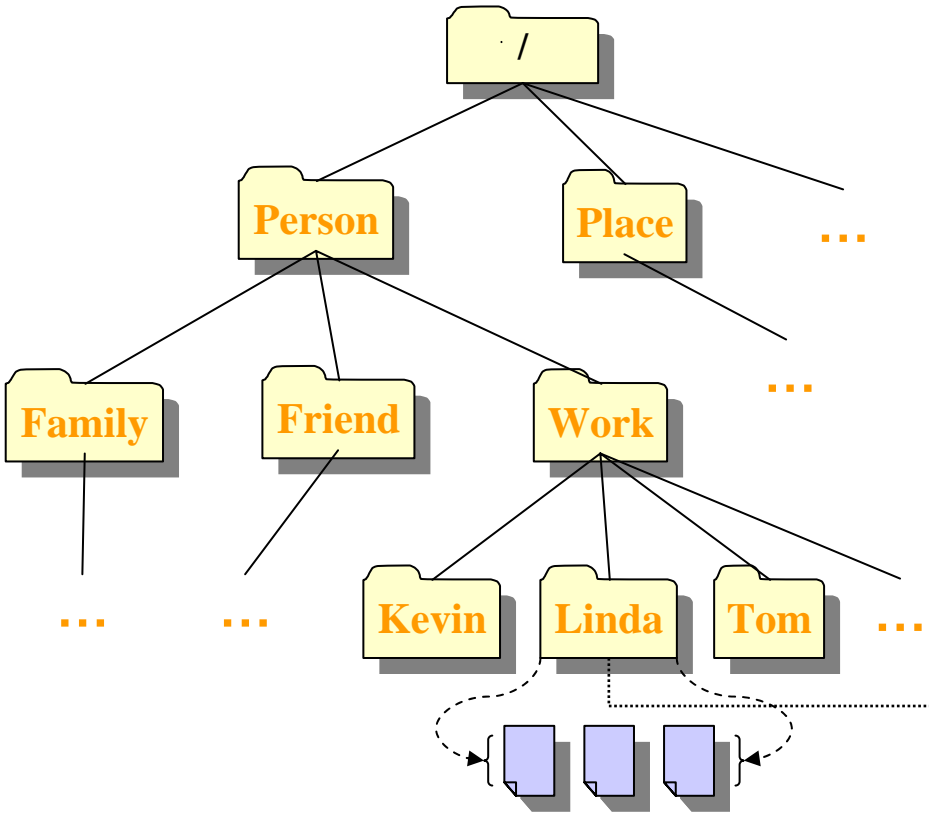

```
<Photo>
  <Who>
    <Name>Linda</Name>
    <Name>Sandy</Name>
  </Who>
  <Where>
    <Park>Yosemite</Park>
    <State>CA</State>
  </Where>
  ...
</Photo>
```

## Contact Collection

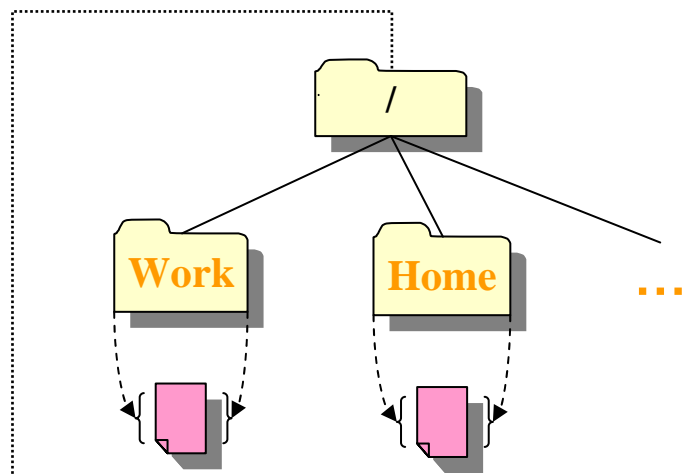

```
<Contact>
  <Name>Linda</Name>
  <Relation>Work</Relation>
  <Affiliation>IBM</Affiliation>
  ...
</Contact>
```

# Multi-collection Operation – Folder traversal to folders/documents in other collections

On Photo Collection

On Contact Collection

# Summary

## ■ Hubble

- ▶ Advanced **dynamic folder technology**
- ▶ Peek deeply into the detail of XML documents
- ▶ Effectively and **precisely categorize** XML document collections
- ▶ Provide advanced functions
  - Variable binding technology
  - Multi-path navigation
  - Multi-collection search and navigation
- ▶ Experiments show efficiency and scalability
